

## SU JOK SEED THERAPY

- The curative force of seeds, especially germinated ones, has been known for long enough, but this problem requires long-term and hard study, since in modern medicine treatment by seed is not an autonomous method but considered to be a subdivision of phytotherapy (herbal treatment). In the phytotherapy, seed and other parts of plants are used only after various kind of processing (thermal, chemical) as infusions, teas, tinctures, fomentations, etc. - Skin application of live seeds practically has not been employed before. That is why in medical literature it is difficult to find information about therapeutic usage of unprocessed seeds which exactly possess enormous curative power, for each seed carries great life power and can share it with us.... - Magazine "ONNURI MEDICINE" No. 3, July - 2000
